

1. (习题十八 5)

$$(2) a + a = (a + a)^2 = a + a + a + a \Rightarrow a + a = 0.$$

$$(1) a + b = (a + b)^2 = a + b + ab + ba \Rightarrow ab + ba = 0, \text{ 由 (2) 得 } ab = ba.$$

(3) 反证, 若 $|R| > 2$ 且 R 是整环, 取 $r \in R \setminus \{0, 1\}$, 则 $r(1 + r) = r + r^2 = r + r = 0$, 但 $r \neq 1 \Rightarrow 1 + r \neq 0$, 所以 r 是零因子, 矛盾.

2. (习题十八 7)

(1) 设 $d \mid n$ 且 $d \in [2, n - 1]$, 则 $d \cdot (n/d) = 0 \in \mathbb{Z}_n$, 它们都是零因子.

(2) 左推右, 设 $\gcd(r, n) = d$, 若 $d > 1$, 则 $r \cdot (n/d) = (r/d)d \cdot n/d = (r/d)n = 0 \in \mathbb{Z}_n$, r 是零因子, 矛盾, 因而必须 $d = 1$.

右推左, 若 $\gcd(r, n) = \gcd(s, n) = 1$ 且 $rs = 0 \in \mathbb{Z}_n$, 则 $\exists k \in \mathbb{N}$, $rs = kn$, 然而 $\gcd(rs, kn) = \gcd(rs, k) < kn$, 矛盾. 所以不可能有 $rs = 0$, r, s 都不是零因子.

$$(3) \{2, 3, 4, 6, 8, 9, 10, 12, 14, 15, 16\}.$$

3. (习题十八 20)

$$(1) \forall r \in R, \forall a \in A, \forall b \in B, r(a + b) = \underset{\in A}{ra} + \underset{\in B}{rb} \in A + B. \text{ 另一侧同理.}$$

(2) 在 $\mathbb{Z}_2^3$ 上 $A = \{(0, 0, 0), (0, 1, 1)\}$, $B = \{(0, 0, 0), (1, 1, 0)\}$, 它们各自是子环, 但

$$A + B = \{(0, 0, 0), (0, 1, 1), (1, 1, 0), (1, 0, 1)\}$$

对乘法不封闭: $(0, 1, 1) \cdot (1, 0, 1) = (0, 0, 1) \notin A + B$.

4. (习题十八 23)

显然 A 交换, D 是子环. 验证 $\forall 2a \in A, \forall 4b \in D, 2a \cdot 4b = 4b \cdot 2a = 4(2ab) \in D$, 所以 D 是理想.

$$A/D = \{a + D : a \in A\} = \{D, 2 + D\} \simeq \{0_{\mathbb{Z}_4}, 2_{\mathbb{Z}_4}\}.$$

5. (习题十八 27)

对任意 $r \in R, s = \sum_{i=1}^m r_i x_i \in S$, 有 $rs = \sum_{i=1}^m (rr_i)x_i \in S$, 即 $rS \subset S$, 交换性给出 $Sr \subset S$, 所以 S 是 R 的理想.

6. (习题十八 31)

(a) $\forall (a + B) \in A/B, (r + B) \in R/B, (a + B)(r + B) = ar + B$, 而 $ar \in A$, 所以 $ar + B \in A/B$, 另一侧同理. A/B 是 R/B 的理想.

(b) 考虑映射 $\varphi : R/B \rightarrow R/A, r + B \mapsto r + A$, 验证:

- φ 良定: 若 $r' = r + b$, 则 $\varphi(r' + B) = r' + A = r + b + A$, 由于 $b \in B \subset A$, 有 $r + b + A = r + A$.
- φ 尊重加法: $\varphi((r + B) + (s + B)) = (r + A) + (s + A) = (r + s) + A = \varphi(r + B) + \varphi(s + B)$.
- φ 尊重乘法: $\varphi((r + B)(s + B)) = rs + A = (r + A)(s + A)$.
- φ 满: $r + B \in \varphi^{-1}(r + A)$. (这个映射只有在 $B \subset A$ 时良定, 因而这里不再显式地依赖 $B \subset A$ 这个性质.)

因而 φ 是同态, $\ker \varphi = \{r + B : r \in A\} = A/B$, 那么 $(R/B)/(A/B) \simeq R/A$.

7. (习题十八 33)

反证, 若 $\varphi(x) = \varphi(y)$ 且 $x \neq y$, 令 $s = x - y$, $\varphi(s) = \varphi(x) - \varphi(y) = 0 = \varphi(0)$, 这导致

$$\forall z \in F_1, \varphi(z) = \varphi(z \cdot 1) = \varphi(z)\varphi(ss^{-1}) = \varphi(z) \cdot 0 \cdot 0 = 0.$$

这与 $\varphi(F_1) \neq \{0\}$ 矛盾.

8. (习题十八 34)

(a) 验证:

- $+$ 封闭:

$$\begin{aligned} (f + g)(x + y) &= f(x + y) + g(x + y) \\ &= f(x) + f(y) + g(x) + g(y) \\ &= (f(x) + g(x)) + (f(y) + g(y)) \\ &= (f + g)(x) + (f + g)(y). \end{aligned}$$

尊重群运算, $f + g \in \text{End}(G)$.

- $\circ$ 封闭:

$$\begin{aligned} (f \circ g)(x + y) &= f(g(x + y)) \\ &= f(g(x) + g(y)) \\ &= f(g(x)) + f(g(y)) \\ &= (f \circ g)(x) + (f \circ g)(y). \end{aligned}$$

尊重群运算, $f \circ g \in \text{End}(G)$.

- $+$ 交换律 / 结合律 / 单位元 / 逆元: 均由 Abel 群性质直接给出.
- $\circ$ 结合律: 映射符合性质直接给出.
- 分配律:

$$(f \circ (g + h))(x) = f((g + h)(x)) = f(g(x) + h(x)) = (f \circ g)(x) + (f \circ h)(x).$$

成立, 另一侧同理.

总之, $(\text{End}(G), +, \circ)$ 是环.

(b) 对任意 $\varphi \in \text{End}(G)$, 确定 $\varphi(a) = a^k$ 时, $\varphi(a^s) = \varphi(a)^s = a^{ks}$ 唯一确定, 因而

$$\text{End}(G) = \{\varphi_k : \varphi_k(a^s) := a^{ks}, k \in \mathbb{Z}_n\}.$$

明显 $\varphi_k + \varphi_s = \varphi_{k+s}$, $\varphi_k \circ \varphi_s = \varphi_{ks}$, 因而

$$(\text{End}(G), +, \circ) \simeq (\mathbb{Z}_n, +, \times).$$

9. (信... 习题六 1)

(2) (排版技术有限, 略调整长除法格式.)

$$\begin{array}{r} x^4 - 2x + 5 \\ \hline x^3 - 2x^2 - 2x + 5 \quad (x^2) \\ \hline -x^2 - 4x + 5 \quad (+x) \\ \hline -5x + 7 \quad (-1) \end{array}$$

结果: $q(x) = x^2 + x - 1, r(x) = -5x + 7$.

(3)

$$\begin{array}{r} 2x^5 - 5x^3 - 8x \\ \hline -6x^4 - 5x^3 - 8x \quad (2x^4) \\ \hline 13x^3 - 8x \quad (-6x^3) \\ \hline -39x^2 - 8x \quad (+13x^2) \\ \hline -117x \quad (-39x) \\ \hline -327 \quad (+109) \end{array}$$

结果: $q(x) = 2x^4 - 6x^3 + 13x^2 - 39x + 109, r(x) = -327$.

10. (信... 习题六 2)

(1) 辗转相除:

$f(x)$	$g(x)$
$x^4 + x^3 - 3x^2 - 4x - 1$	$x^3 + x^2 - x - 1$
$-2x^2 - 3x - 1$	$-\frac{3}{4}x - \frac{3}{4}$
0	

因而 $\gcd(f, g) = x + 1$.

(2) 辗转相除:

$f(x)$	$g(x)$
$x^4 - 4x^3 + 1$	$x^3 - 3x^2 + 1$
$-3x^2 - x + 2$	$\frac{16}{9}x - \frac{11}{9}$
$c \in \mathbb{Q} \setminus \{0\}$	0

其中 c 是一个难算的非零有理数. 因而 $\gcd(f, g) = 1$.

11. (信... 习题六 3)

(1) 扩展 Euclid 法:

$f(x)$	$g(x)$	$u(x)$	$v(x)$
$x^4 + 2x^3 - x^2 - 4x - 2$	$x^4 + x^3 - x^2 - 2x - 2$		
$1 \cdot g(x) + (x^3 - 2x)$		$-x - 1$	$x + 2$
	$(x + 1) \cdot f(x) + (x^2 - 2)$	$-x - 1$	1
$x \cdot g(x) + 0$		0	1

结果: $u(x) = -x - 1, v(x) = x + 2$.

(3) 扩展 Euclid 法:

$f(x)$	$g(x)$	$u(x)$	$v(x)$
$x^4 - x^3 - 4x^2 + 4x + 1$	$x^2 - x - 1$		
$(x^2 - 3) \cdot g(x) + (x - 2)$		$-x - 1$	$1 + (x + 1)(x^2 - 3)$
	$(x + 1) \cdot f(x) + 1$	$-x - 1$	1
$(x - 2) \cdot g(x) + 0$		0	1

结果: $u(x) = -x - 1, v(x) = x^3 + x^2 - 3x - 2$.

12. (信... 习题六 9)

$$(1) f' = 5x^4 - 20x^3 + 21x^2 - 4x + 4.$$

$f(x)$	$f'(x)$
$x^5 - 5x^4 + 7x^3 - 2x^2 + 4x - 8$	$5x^4 - 20x^3 + 21x^2 - 4x + 4$
$2x^3 - 5x^2 - 4x + 12$	
	$x^2 - 4x + 4$
0	

$\gcd(f, f') = (x - 2)^2$, 因而 f 有重因式.

13. (信... 习题六 10)

$f = x^3 + px + q, f' = 3x^2 + p$, 若 $p = 0$, 明显此时 $q = 0$ 时才有重因式. 否则

$$\begin{aligned} \gcd(f, f') &= \gcd(2px + 3q, 3x^2 + p) \\ &= \gcd\left(2px + 3q, p + \frac{27q^2}{4p^2}\right) \end{aligned}$$

此时 $4p^3 + 27q^2 = 0$ 时 f 有重因式. 总之, 当且仅当 $4p^3 + 27q^2 = 0$ (蕴含 $p = q = 0$ 的情况), f 有重因式.

14. (信... 习题六 12)

$$\begin{aligned} f(x) &= x^{214} + 3x^{152} + 2x^{47} + 1 \\ &= x^2 + 3x^0 + 2x^3 + 1 \\ &= 2x^3 + x^2 + 4. \end{aligned}$$

因而 $f(3) = 2$.
